End-user extensibility features, both stand-alone tools and AutoCAD's own DLLs, provide APIs for customizing and automating user interaction with AutoCAD. A module-based command line interface allows programs to be developed without having to create the command objects. This allows multiple modules to be created which can interact with one another. Additional details can be found in the AutoCAD Application Programming Guide, included with AutoCAD. References

Helicobacter pylori is a gastric pathogen that colonizes the stomachs of up to half of the world's population. This Gram-negative bacterium persists in the stomachs of infected individuals for decades. HpB2.R, an LPS-induced protein that shares a pI of 5.2 and is also known as GroES, was cloned from a cDNA library of a cytotoxin-producing strain of *H. pylori*. The predicted HpB2.R protein consists of 382 amino acid residues with a molecular mass of 41.5 kDa and a pI of 5.2. The putative sequence shows 62% homology with the C-terminal region of *Escherichia coli* GroES. HpB2.R is a universal chaperone that consists of two domains: a nucleotide binding domain (NBD) and a GroES-like domain (Gld). When cell extract was incubated with radiolabeled ATP, large amounts of HpB2.R were formed. When HpB2.R was purified by chromatography, it consisted of a nucleotide binding (NBD) domain and a GroES-like (Gld) domain. It did not contain either ATP-binding domains or a lid domain. The Gld domain of HpB2.R was phosphorylated by a specific protein kinase in *H. pylori*. The NBD domain of HpB2.R, and GroES of *E. coli*, a1d647c40b
