Microbiological characterization of meat and meat products from swine farms and slaughterhouse processing plants. The microbiological characterization of meat and meat products from swine farms and slaughterhouse processing plants was conducted using quantitative and semiquantitative methods. A total of 596 samples were collected from Swine Farms and 66 samples from Slaughterhouse Processing Plants. Microbial load ranged between 4 and 6.3 log CFU/g. Salmonella sp. was detected in a total of 30 (5.1%) of the samples. The pathogenic bacteria *Listeria monocytogenes* and *Escherichia coli* O157:H7 were not detected in any of the samples. Based on the results obtained from this research, the microbiological quality of meat and meat products from swine farms and slaughterhouse processing plants is satisfactory.

Histiocytic necrotizing lymphadenitis in an adult--a case report. Histiocytic necrotizing lymphadenitis (HNL) is a rare, non-fatal disease that occurs in childhood. In adults, the disease is characterized by cervical lymphadenopathy associated with fever and progressive tenderness of the involved neck. Histopathologically, HNL is characterized by necrotic center surrounded by numerous histiocytic cells. We report the case of a young man with HNL who presented with swollen and painful cervical lymph nodes, in association with a systemic disease that eventually led to death.

Nano-architecture engineering of SmFeO₃ perovskite nanocubes for high-efficiency photocatalysis. The development of advanced photocatalytic materials with high photocatalytic activity and stability requires a detailed understanding of their nano-architecture. Herein, we employed an ultrasonic spray pyrolysis (USP) method to synthesize well-crystallized Fe-doped orthorhombic SmFeO₃ perovskite (SFO) nanocubes. By tuning the spray-pyrolysis process conditions (i.e., calcination temperature, spraying rate, and chemical composition), the SFO nanocubes with an average size of around 200 nm were successfully synthesized. The SFO nanocubes possess well-defined Fe-doped {100} mesoporous channels, exposed {110} facets, and smooth surface termination. The S 82138339de
