Furmark - a new utility that combines the power of the established market for the buying and selling of pirated products. Our main focus was to implement the full functionality of the Furmark software on the OS X platform. The goal was clear: to develop a fast, reliable and easy-to-use application that will allow you to check the average benchmark of your computer, so you can make the right decisions about buying an Apple product. Do not forget that there is nothing new or groundbreaking about Furmark, as the entire process is performed on the infrastructure of the previously existing software. This means that the entire set of features is fully supported: you will be able to optimize your system by specifying the quality of the disk you have purchased, the quality of the battery that you use, the specific speed of your processor, the speed of your RAM, the type of your screen, the color depth, etc. etc. All this will take place while you are using the Furmark utility. Of course, to achieve high accuracy, we ensure that we are only averaging the first benchmark that you specify,

thus preventing the average CPU usage from significantly fluctuating (it does not consider the power-saving technologies of the CPU, such as C1E, C3E, or even HT technology). Furmark does not cost anything, and you do not have to register to use it. Furmark lets you know when the quality of the system falls below the desired benchmark, as well as when the quality reaches the desired benchmark. In other words, you will be able to buy a product with 100% confidence. You will also be able to find out whether your computer or battery is consistent with the specifications of the manufacturers or varies from the original specifications. We have also implemented useful tools for you: There is a diagnostic dialog in which you can find out what is the cause of the problems with your system. Furmark can export the results to CSV or TXT formats. Furmark provides a convenient HTML report of CPU and memory benchmark results. Thanks to the advanced algorithm, Furmark is able to analyze and calculate the scores of your CPU and memory in a timely manner. Not only that, but Furmark is able to analyze the CPU and memory with maximum accuracy. How to use the Furmark application: Open Furmark and select your monitor Click Options to open the b7e8fdf5c8

Proxy Manager

Proxy Manager is a tiny and portable Windows program with a simple functionality: it quickly connects to proxies defined by users, supplying them with two favorite choices. The app does not come bundled with complex options or configuration settings, so it can be used even by novices when it comes to networking utilities. As there is no installation involved, you can just drop the executable file somewhere on the hard disk and click it to run. Another possibility is to save a copy of Proxy Manager to a USB flash disk or similar storage unit, to be able to run it on any computer with minimum effort, as long as it has .NET Framework installed. What's more, the program does not create new keys in the Windows registry, nor extra files on the HDD without your consent, leaving the system clean after its removal. The interface does not stand out from the graphics point of view. On the other hand, it presents an approachable layout that allows you to simply enter a URL and port number in order to connect to a proxy. As previously mentioned, it is possible to create two favorites. The main frame also shows the current proxy status. Apart from the fact that you can clear the proxy, there are no other notable features available here. Proxy Manager does not put a strain on computer performance, since it runs on a pretty light quantity of CPU and RAM. It is very responsive to commands and works well, without causing Windows to hang, crash or display error messages. Thanks to its intuitive layout and overall simplicity, Proxy Manager can be used by anyone. What's new in this version: - Since its previous version, Proxy Manager has been updated to an advanced version of .NET Framework, which has been designed in order to optimize the app. In this way, it takes advantage of all its capabilities and features. - Proxy Manager now supports TCP and HTTP proxies. - Proxy Manager now supports HTTP/2, allowing connections to servers that are not vulnerable to the flow-control issue. - Proxy Manager now comes with an AutoConfig utility, a new feature that helps you define several proxies just by clicking on a button. However, there are a few online service providers that can be connected to only via a proxy. When a browser wants to connect to an online service provider via proxy, it must connect to a server on port 80. The proxy will then determine the address of the target server and redirect the browser to that address.
