In known mechanical control systems for operating vehicle components, power cables are provided which extend from the vehicle body to the component to be operated. For example, in a power steering system, a fluid pressure operated device is utilized to provide either a right or left turning assistance to the vehicle wheels, such as a steering wheel. Therefore, a power cable extends from the vehicle body to the power operated device. In this known type of system, the power cable is provided with a harness which is arranged to be located adjacent a cable holder or bracket mounted to the vehicle body. The harness is routed about the vehicle body to an operative connection at the vehicle component. In one type of device, the control cable is routed about the vehicle body in a radial direction parallel to the operating axis of the vehicle component, i.e., the steering wheel. In this type of device, the cable remains in a substantially stationary position as the vehicle changes direction. In some applications of such a type of system, this stationary mounting
